Conclusion

Air Fryer Market

- The Air Fryer market is currently valued globally at **USD 10.54 billion**, and is projected to grow to **USD 20.99 billion** by 2034¹
- The most popular market for these products is in the **Asia Pacific region** (particularly China, India, Japan, and South Korea), with it holding a market share of **46.34%** - though there has also been significant growth in **North American** markets.¹
- They are primarily sold in **supermarkets** and **e-commerce platforms**.¹

Product description: An air fryer is a **compact, countertop convection oven** designed to simulate deep-frying by circulating hot air around food, creating a crispy texture with little to no oil.²

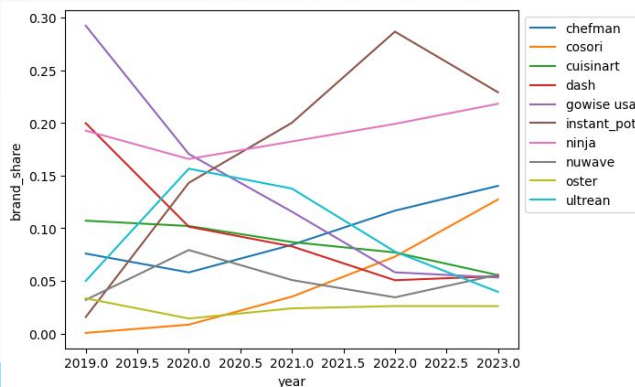

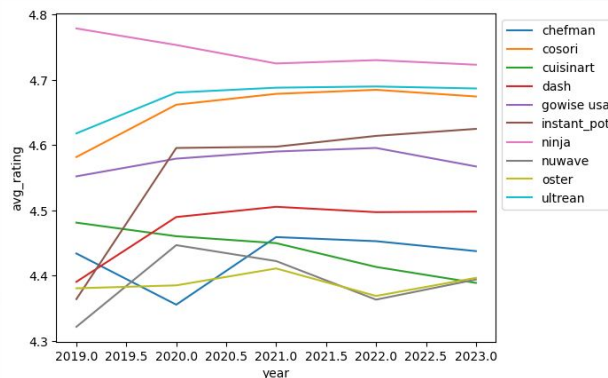

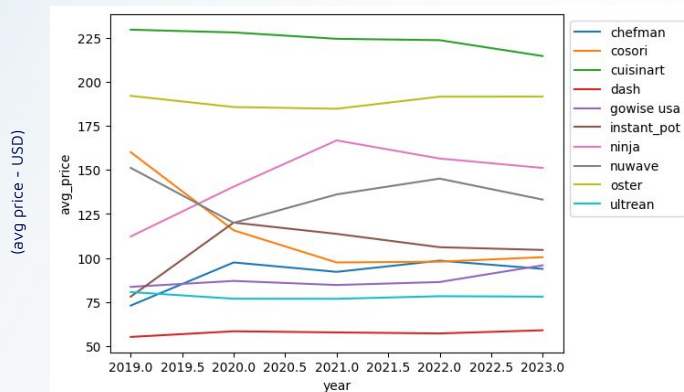

Sector: Kitchen Electronics / Home Appliances

We looked at 10 popular brands in the air fryer market for our analysis: Chefman, Cosori, Cuisinart, GoWISE USA, Instant Pot, Ninja, Nuwave, Oster, and Ultrean.

2: <https://www.kitchenaid.com/countertop-appliances/pinch-of-help/what-is-an-air-fryer-and-how-to-air-fry-guide>

Air Fryer Market Over Time

- The **most expensive** brand is consistently Cuisinart, and the **least expensive** brand is consistently Dash
- The **highest rated** brand is consistently Ninja, with the **lowest rated** brands usually being Nuwave or Oster
- The brand with the **highest share** has changed significantly in the recorded 4-year period, but the current two highest shares are from Instant Pot and Ninja

Demand Model Explanation

For this analysis, we estimate our demand model using linear regression.

This tells us, for any change in a given input, how much our output is expected to change.

How this works is:

1. We input certain parameters (price, rating, feature share, brand, year) into our model - This is our 'X'!
2. We assign an output (brand share) to the input - this is our 'Y'!
3. We train the model based on this equation:

$$Y = \beta_0 + \beta_i X_i$$

Where 'i' is each of our individual parameters.

4. We find the β_i coefficient values that minimize the error when predicting 'Y'
5. We use this to predict new values for any observation - *and see which features carry the most weight.*

The Estimated Price Coefficient

Found to be: **-0.037558**

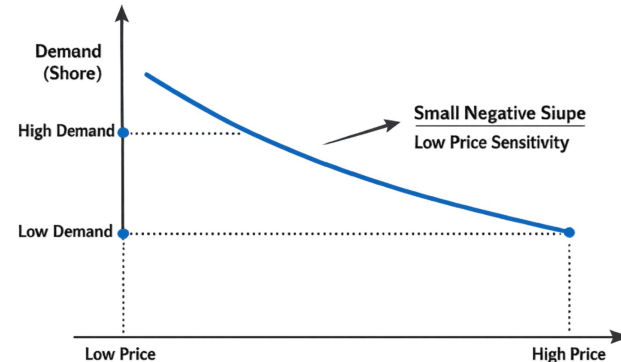

The price coefficient is **NEGATIVE** and an extremely **SMALL** number

This suggests higher prices **reduce** demand
(since negative)

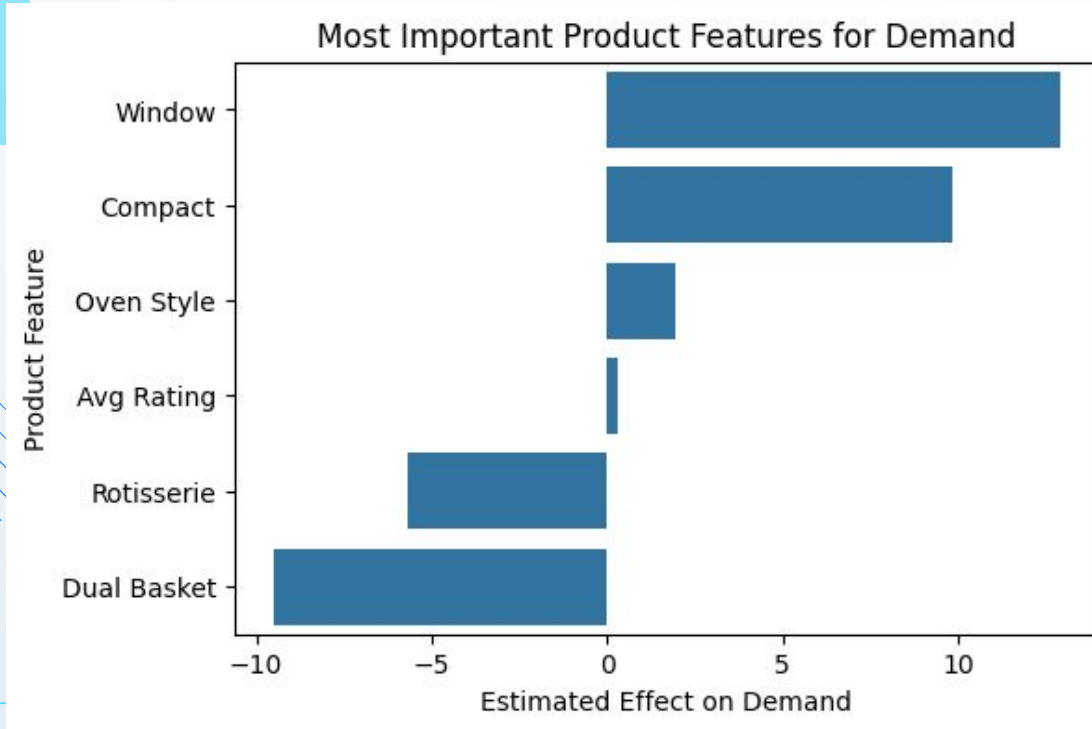

&

demand **IS NOT** sensitive to price
(small number)

Demand is Weakly Sensitive to Price

The Best Product Features

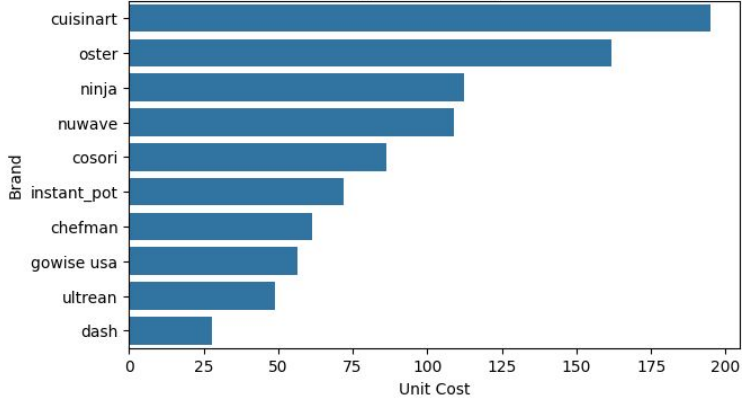

- The most important product features are the airfryer window, compact-ness (smaller), and oven-style (more like a traditional mini-oven).
- The Rotisserie and dual basket features have a lower market share and are less preferred compared to the others.

Unit Costs, Markups, & Share-Weighted Profits

Profits

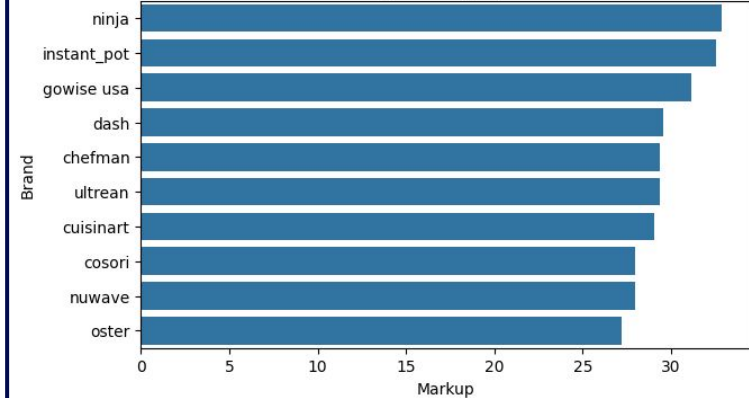

Average Unit Cost by Brand

Profit per unit
(price - cost)

All brands have
similar range of
markup (\$26-32)

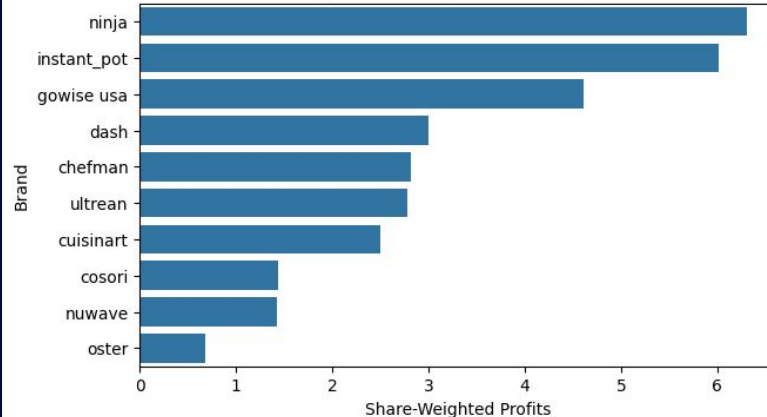

Average Markup by Brand

Unit Cost = how much it costs
the company to make the air
fryer

Cuisinart, Oster, and Ninja
have the highest costs.

Average Share-Weighted Profits by Brand

How profitable a brand is
overall (brand share x
markup)

Ninja makes the most
profit followed closely by
Instant Pot and Gowise
USA

Despite Cuisinart and
Oster having high unit
costs, it does not make
much weighted-profit

Conclusion

- Ninja seems to be the strongest overall performer with high market shares and the highest share-weighted profits.
- Instant Pot and Gowise USA also perform well with a strong market presence.
- Even being a high-cost brand, like Cuisinart and Oster, does not equal high overall profitability.
- This leads to questions like:

Why certain brands (like Ninja) are able to capture both high share and high profits (could it be high-demand product features)?

Would lowering prices further increase demand, even with low price sensitivity?

Even if rating doesn't have much impact on demand, does demand have an impact on rating? What features contribute most to a highly-rated product?

Thank You!
